Revolutionary Healthcare Communication

Improve Patient Care with ABBY

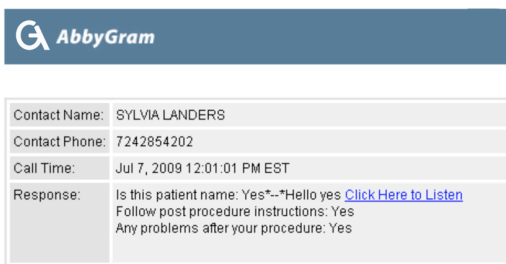

Abby is an artificial intelligence engine that can talk, listen, ask and answer questions all in a conversation. The more your patients interact with Abby, the more she learns. Abby's patented process begins with collecting patient information. When a patient calls in, Abby converts all speech to text, captures that information and delivers higher quality treatment. Abby allows patients to ask open-ended questions for immediate answers or support.

Patient Knowledge. Reduce Labor. Patient Retention.

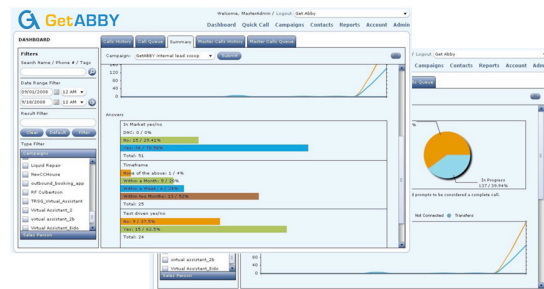

Abby is simple and easy to use. All patient **interactions are stored** in Abby's database and integrate with your existing clinical system in **real time**. Abby uses this information to increase patient knowledge and **deliver higher quality treatment**.

Abby's **goal oriented engine** will keep you and your customers updated on appointments, schedules, **prescription refills** and more. With these simple processes being automated, your nurses will **save time and remain consistent**.

Abby can be **implemented** with a **hosted or on-site** solution in as little as a **few days**. Abby can automatically notify your patients, survey them, or even provide healthcare tips. Together, these services **improve quality** of patient care and retention.

Powerful communication tools allow patients to connect with nurses online, over the phone or through a mobile device (SMS). Improving nurse productivity and support.

Abby's uses statistical modeling and reporting to improve your patient knowledge and quality of service.
